## TITLE

5           ANTIPICORNAVIRAL COMPOUNDS AND COMPOSITIONS, THEIR  
          PHARMACEUTICAL USES, AND MATERIALS FOR THEIR SYNTHESIS

          This application claims benefit of U.S. Provisional Patent Application No.  
60/211,424, filed June 14, 2000.

10

## BACKGROUND OF THE INVENTION

## Field of the Invention

          The invention relates to compounds that advantageously inhibit the enzymatic  
15   activity of picornaviral 3C proteases, especially rhinovirus 3C proteases (RVPs), and that  
retard viral growth in cell culture. The invention also relates to the use of such compounds  
in pharmaceutical compositions and therapeutic treatments for rhinoviral infections. The  
invention further relates to processes for synthesizing such compounds and intermediate  
compounds useful in such syntheses.

20

## Related Background Art

          The picornaviruses are a family of tiny non-enveloped positive-stranded  
RNA-containing viruses that infect humans and other animals. These viruses include the  
human rhinoviruses, human polioviruses, human coxsackieviruses, human echoviruses,  
25   human and bovine enteroviruses, encephalomyocarditis viruses, meningitis virus, foot and  
mouth viruses, hepatitis A virus, and others. The human rhinoviruses are a major cause of  
the common cold. To date, there are no effective therapies that cure the common cold,  
only treatments that relieve the symptoms.

Picornaviral infections may be treated by inhibiting the proteolytic 3C enzymes. These enzymes are required for the natural maturation of the picornaviruses. They are responsible for the autocatalytic cleavage of the genomic, large polyprotein into the essential viral proteins. Members of the 3C protease family are cysteine proteases, where  
5 the sulfhydryl group most often cleaves the glutamine-glycine amide bond. Inhibition of 3C proteases is believed to block proteolytic cleavage of the polyprotein, which in turn can retard the maturation and replication of the viruses by interfering with viral particle production. Therefore, inhibiting the processing of this cysteine protease with selective molecules that are specifically recognized should represent an important and useful  
10 approach to treat and cure viral infections of this nature and, in particular, the common cold.

Some inhibitors of the enzymatic activity of picornaviral 3C proteases (i.e., antipicornaviral compounds) have been recently discovered. See, for example: U.S. Patent No. 5,856,530; U.S. Patent No. 5,962,487; U.S. Patent Application No. 08/991,282,  
15 filed December 16, 1997, by Dragovich et al.; and U.S. Patent Application No. 09/301,977, filed April 29, 1999, by Dragovich et al. See also: Dragovich et al., "Structure-Based Design, Synthesis, and Biological Evaluation of Irreversible Human Rhinovirus 3C Protease Inhibitors . . .," *J. Med. Chem.* (1999), Vol. 42, No. 7, 1203-1212, 1213-1224; and Dragovich et al., "Solid-phase Synthesis of Irreversible Human  
20 Rhinovirus 3C Protease Inhibitors . . .," *Bioorg. & Med. Chem.* (1999), Vol. 7, 589-598. There is still a desire, however, to discover compounds that are especially potent antipicornaviral agents.

"Heteroaryloxy" is intended to mean the radical  $-\text{OR}_d$ , where  $\text{R}_d$  is a heteroaryl group. "Arylthio" is intended to mean the radical  $-\text{SR}_c$ , where  $\text{R}_c$  is an aryl group. "Heteroarylthio" is intended to mean the radical  $-\text{SR}_d$ , where  $\text{R}_d$  is a heteroaryl group. The alkyl, cycloalkyl, aryl, heterocycloalkyl and heteroaryl groups and the substituents containing these groups, as defined hereinabove, may be optionally substituted by at least one other substituent. The term "optionally substituted" is intended to expressly indicate that the specified group is unsubstituted or substituted by one or more suitable substituents. Various groups may be unsubstituted or substituted (i.e., they are optionally substituted) as indicated.

If an inventive compound is a base, a desired salt may be prepared by any suitable method known in the art, including treatment of the free base with an inorganic acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like, or with an organic acid, such as acetic acid, maleic acid, succinic acid, mandelic acid, fumaric acid, malonic acid, pyruvic acid, oxalic acid, glycolic acid, salicylic acid, pyranosidyl acid, such as glucuronic acid or galacturonic acid, alpha-hydroxy acid, such as citric acid or tartaric acid, amino acid, such as aspartic acid or glutamic acid, aromatic acid, such as benzoic acid or cinnamic acid, sulfonic acid, such as p-toluenesulfonic acid or ethanesulfonic acid, or the like.

If an inventive compound is an acid, a desired salt may be prepared by any suitable method known to the art, including treatment of the free acid with an inorganic or organic base, such as an amine (primary, secondary, or tertiary); an alkali metal or alkaline earth metal hydroxide; or the like. Illustrative examples of suitable salts include organic salts derived from amino acids such as glycine and arginine; ammonia; primary, secondary, and tertiary amines; and cyclic amines, such as piperidine, morpholine, and piperazine; as well as inorganic salts derived from sodium, calcium, potassium, magnesium, manganese, iron, copper, zinc, aluminum, and lithium.

All compounds of this invention contain at least one chiral center and may exist as single stereoisomers (e.g., single enantiomers or diastereomers), any mixture of

stereoisomers (e.g., any mixture of enantiomers or diastereomers) or racemic mixtures thereof. All such single stereoisomers, mixtures and racemates are intended to be encompassed within the broad scope of the present invention. Where the stereochemistry of the chiral carbons present in the chemical structures illustrated herein is not specified, the chemical structure is intended to encompass compounds containing either stereoisomer of each chiral carbon. When used describe a particular compound, the term "optically pure" is used herein to indicate that the compound is substantially enantiomerically or diastereomerically pure. Compounds that are substantially enantiomerically pure contain at least 90% of a single isomer and preferably contain at least 95% of a single isomer. Compounds that are substantially diastereomerically pure contain at least 90% of a single isomer of each chiral carbon center present in the diastereomer, and preferably contain at least 95% of a single isomer of each chiral carbon. More preferably, when an optically active compound is desired, it contains at least 97.5% of a single isomer and, most preferably, at least 99% of the single isomer. Compounds identified herein as single stereoisomers are meant to describe compounds that are present in a form that contains at least 90% of a single isomer. The terms "racemate" and "racemate mixture" refer to a mixture of equal amounts of enantiomeric compounds, which encompass mixtures of enantiomers and mixtures of enantiomeric diastereomers.

The compounds of this invention may be obtained in stereochemically (e.g., enantiomerically or diastereomerically ) pure or substantially stereochemically pure form. Such compounds may be obtained synthetically, according to the procedures described herein using optically pure or substantially optically pure materials. Alternatively, these compounds may be obtained by resolution/separation of a mixture of stereoisomers, including racemic mixtures, using conventional procedures. Exemplary methods that may be useful for the resolution/separation of stereoisomeric mixtures include chromatography and crystallization/re-crystallization. Other useful methods may be found in "Enantiomers, Racemates, and Resolutions," J. Jacques et al., 1981, John Wiley and Sons, New York, NY, the disclosure of which is incorporated herein by reference. Preferred stereoisomers of the compounds of this invention are described herein.

The compounds of this invention may also exhibit the phenomenon of tautomerism. The structural formulae herein may depicted one of the possible tautomeric forms but it should be understood that the invention nonetheless encompasses all tautomeric forms of the compound.

The invention also relates to prodrugs, pharmaceutically acceptable salts, pharmaceutically active metabolites, and pharmaceutically acceptable solvates of compounds of the Formula I, II, III, IV and V.

In embodiments of this invention when  $A_2$  is absent and  $A_3$  is present (m is 0 and p is 1-5), the dotted line between  $A_1$  and  $A_2$  represents a hydrogen and the dotted line between  $A_2$  and  $A_3$  represents a hydrogen (e.g.,  $A_1$  is  $CH_2$  or  $NH$  and  $A_3$  is  $CH(R^h)(R^i)$ ,  $NH(R^j)$ ,  $SH$ ,  $S(O)H$ ,  $S(O)_2H$ , or  $OH$ ); and when  $A_2$  is present and  $A_3$  is absent (m is 1 and p is 0), the dotted line between  $A_1$  and  $A_2$  represents a bond and  $A_2$  is  $C(R^h)(R^i)(R^j)$ ,  $N(R^i)(R^j)$ ,  $S(R^i)$ ,  $S(O)(R^i)$ ,  $S(O)_2(R^i)$ , or  $O(R^i)$  or the dotted line between  $A_2$  and  $A_3$  represents a hydrogen and  $A_2$  is  $CH(R^h)(R^i)$ ,  $NH(R^j)$ ,  $SH$ ,  $S(O)H$ ,  $S(O)_2H$ , or  $OH$ . In preferred embodiments of the compounds of each of the above-described Formulas, m is 1 and p is 1 or 2 or m is 0 and p is 0 or m is 1 and p is 0. More preferably, when m is 1 and p is 1 or 2,  $A_2$  and  $A_3$  are both  $C(R^h)(R^i)$ . More preferably, m is 1 and p is 1.

Examples of solvates include compounds of the invention in combination with water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, or ethanolamine. In the case of compounds, salts, or solvates that are solids, it is understood by those skilled in the art that the inventive compounds, salts, and solvates may exist in different crystal forms, all of which are intended to be within the scope of the present invention and specified formulas.

The activity of the inventive compounds as inhibitors of picornaviral 3C protease activity may be measured by any of the suitable methods known to those skilled in the art, including *in vivo* and *in vitro* assays. An example of a suitable assay for activity measurements is the antiviral H1-HeLa cell culture assay described herein.

Administration of the compounds of the formula I and their pharmaceutically acceptable prodrugs, salts, active metabolites, and solvates may be performed according to any of the accepted modes of administration available to those skilled in the art. Illustrative examples of suitable modes of administration include oral, nasal, parenteral, topical, transdermal, and rectal. Oral and intranasal deliveries are especially preferred.

An inventive compound of formula I or a pharmaceutically acceptable salt, prodrug, active metabolite, or solvate thereof may be administered as a pharmaceutical composition in any pharmaceutical form recognizable to the skilled artisan as being suitable. Suitable pharmaceutical forms include solid, semisolid, liquid, or lyophilized formulations, such as tablets, powders, capsules, suppositories, suspensions, liposomes,

and aerosols. Pharmaceutical compositions of the invention may also include suitable excipients, diluents, vehicles, and carriers, as well as other pharmaceutically active agents, depending upon the intended use. In preferred embodiments, the inventive pharmaceutical compositions are delivered intranasally in the form of suspensions.

5           The compounds (active ingredients) may be formulated into solid oral dosage forms which may contain, but are not limited to, the following active ingredients: diluents (i.e., lactose, corn starch, microcrystalline cellulose), binders (i.e., povidone, hydroxypropyl methylcellulose), disintegrants, (i.e., crospovidone, croscarmellose sodium), lubricants (i.e., magnesium stearate, stearic acid), colorants (FD&C lakes or  
10       dyes). Alternatively, the compounds may be formulated into other oral dosage forms including liquids, suspensions, emulsions, or soft gelatin capsules, with each dosage form having a unique set of ingredients.

          Acceptable methods of preparing suitable pharmaceutical forms of the pharmaceutical compositions are known or may be routinely determined by those skilled  
15       in the art. For example, pharmaceutical preparations may be prepared following conventional techniques of the pharmaceutical chemist involving steps such as mixing, granulating, and compressing when necessary for tablet forms, or mixing, filling, and dissolving the ingredients as appropriate, to give the desired products for oral, parenteral, topical, intravaginal, intranasal, intrabronchial, intraocular, intraaural, and/or rectal  
20       administration.

          Solid or liquid pharmaceutically acceptable carriers, diluents, vehicles, or excipients may be employed in the pharmaceutical compositions. Illustrative solid carriers include starch, lactose, calcium sulfate dihydrate, terra alba, sucrose, talc, gelatin, pectin, acacia, magnesium stearate, and stearic acid. Illustrative liquid carriers include syrup,  
25       peanut oil, olive oil, saline solution, and water. The carrier or diluent may include a suitable prolonged-release material, such as glyceryl monostearate or glyceryl distearate, alone or with a wax. When a liquid carrier is used, the preparation may be in the form of a syrup, elixir, emulsion, soft gelatin capsule, sterile injectable liquid (e.g., solution), or a nonaqueous or aqueous liquid suspension.

30           A dose of the pharmaceutical composition contains at least a therapeutically effective amount of the active compound (i.e., a compound of formula I or a pharmaceutically acceptable salt, prodrug, active metabolite, or solvate thereof), and preferably is made up of one or more pharmaceutical dosage units. The selected dose may

be administered to a mammal, for example, a human patient, in need of treatment mediated by inhibition of picornaviral 3C protease activity, by any known or suitable method of administering the dose, including topically, for example, as an ointment or cream; orally; rectally, for example, as a suppository; parenterally by injection; or  
5 continuously by intravaginal, intranasal, intrabronchial, intraaural, or intraocular infusion. A "therapeutically effective amount" is intended to mean the amount of an inventive compound that, when administered to a mammal in need thereof, is sufficient to effect treatment for disease conditions alleviated by the inhibition of the activity of one or more picornaviral 3C proteases, such as human rhinoviruses, human poliovirus, human  
10 coxsackieviruses, encephalomyocarditis viruses, menigovirus, and hepatitis A virus. The amount of a given compound of the invention that will be therapeutically effective will vary depending upon factors such as the particular compound, the disease condition and the severity thereof, the identity of the mammal in need thereof, which amount may be routinely determined by artisans.

## SYNTHESES

Examples of various preferred compounds of formula I are set forth below. The structures of the compounds of the following examples were confirmed by one or more of the following: proton magnetic resonance spectroscopy, infrared spectroscopy, elemental  
20 microanalysis, mass spectrometry, thin layer chromatography, melting-point determination, and boiling-point determination.

Proton magnetic resonance ( $^1\text{H}$  NMR) spectra were determined using a Bruker or a Varian UNITY*plus* 300 spectrometer operating at a field strength of 300 megahertz (MHz). Chemical shifts are reported in parts per million (ppm,  $\delta$ ) downfield from an  
25 internal tetramethylsilane standard. Alternatively,  $^1\text{H}$  NMR spectra were referenced to residual protic solvent signals as follows:  $\text{CHCl}_3 = 7.26$  ppm; DMSO = 2.49 ppm;  $\text{C}_6\text{HD}_5 = 7.15$  ppm. Peak multiplicities are designated as follows: s = singlet; d = doublet; dd = doublet of doublets; t = triplet; q = quartet; br = broad resonance; and m = multiplet. Coupling constants are given in Hertz. Infrared absorption (IR) spectra were  
30 obtained using a Perkin-Elmer 1600 series FTIR spectrometer. Elemental microanalyses were performed by Atlantic Microlab Inc. (Norcross, GA); results of the microanalyses are stated within  $\pm 0.4\%$  of the theoretical values. Flash column chromatography was

performed using Silica gel 60 (Merck Art 9385). Analytical thin layer chromatography (TLC) was performed using precoated sheets of Silica 60 F254 (Merck Art 5719).

Melting points (abbreviated as mp) were determined on a Mel-Temp apparatus and are uncorrected. All reactions were performed in septum-sealed flasks under a slight positive pressure of argon, unless otherwise noted. All commercial reagents were used as received from their respective suppliers.

In addition, for convenience a number of abbreviations are used. Solvents are denoted CH<sub>3</sub>OH (methanol); DME (ethylene glycol dimethyl ether); DMF (*N,N*-dimethylformamide); DMSO (dimethylsulfoxide); Et<sub>2</sub>O (diethyl ether); EtOAc (ethyl acetate); EtOH (ethanol); and MTBE (*tert*-butyl methyl ether). Certain substituents are referred to as Ac (acetyl); Me (methyl); Ph (phenyl); and Tr (triphenylmethyl). Protecting groups are abbreviated Cbz (benzyloxycarbonyl) and Boc (*tert*-butoxycarbonyl).

Various reagents used were denoted BINAP (2,2'-bis(diphenylphosphino)-1,1'-binaphthyl); DBU (1,8-diazabicyclo[5.4.0]undec-7-ene); DCC (dicyclohexylcarbodiimide); DDQ (2,3-dichloro-5,6-dicyano-1,4-benzoquinone); DIBALH (diisobutyl aluminum hydride); DIEA (*N,N*-diisopropylethylamine); DMAP (4-dimethylaminopyridine); EDC (1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride); HATU (*O*-(7-azabenzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate); HOBt (1-hydroxybenzotriazole hydrate); IBX (1,1-dihydro-1,2-benziodoxol-3(*1H*)-one); LiHMDS (lithium bis(trimethylsilyl)amide); Pd-C (10% palladium on carbon); PyBOP (benzotriazole-1-yl-oxy-tris-pyrrolidino-phosphonium hexafluorophosphate); TBAF (*tert*-butyl ammonium fluoride); TBSCl (*tert*-butyl dimethylsilyl chloride); and TFA (trifluoroacetic acid).

**Example 25: Preparation of 6-carbamoyl-4S-[(naphthalene-2-carbonyl)-amino]-hex-2-enoic acid ethyl ester**

**(a) Preparation of functionalized resin**

FMOC-Rink polystyrene resin (2.40 g, 1.58 mmol) (Dragovich et al. *J. Med. Chem.* (1998) 41:2819) was treated with a 1:1 solution of DMF-piperidine (25 mL) to remove the FMOC. The slurry was agitated 15 minutes, then washed with DMF (3x10 mL), MeOH (3x10 mL), then  $CH_2Cl_2$  (3x10 mL). The resin was then treated with a solution of FMOC-4-amino-hept-2-enedioic acid-1-ethyl ester (1.5 eq, 2.37 mmol, 1.00 g), DIEA (2 eq, 4.74 mmol, 0.82 mL), and HATU (1 eq, 2.37 mmol, 0.90 g) in DMF (25 mL). The resulting mixture was agitated 1 h, then washed with DMF (3x10 mL), MeOH (3x10 mL), then  $CH_2Cl_2$  (3x10 mL). The FMOC was removed by treatment with a 2% DBU-DMF solution (25 mL), and agitated 1 h. The resin was washed with  $CH_2Cl_2$  (3x10 mL). This resin was used for all subsequent compound preparations.

**(b) Conversion to Compound 25**

The functionalized resin prepared above (100 mg, 0.059 mmol) was suspended in a solution of DMF (5 mL) and DIEA (6 eq, 0.35 mmol, 0.07 mL), then treated with 2-naphthoic acid (3 eq, 0.18 mmol, 34 mg) and HATU (3 eq, 0.18 mmol, 68 mg), then agitated for 2 h. The resin was washed with  $CH_2Cl_2$  (3x10 mL), then suspended in a 95:5 TFA-  $CH_2Cl_2$  solution (10 mL) for 1 h, with vigorous stirring. The resin was removed by filtration, and the filtrate was evaporated. The resulting oil was purified by silica gel chromatography to yield 13 mg (63%) of product **25**.  $^1H$  NMR ( $CDCl_3$ )  $\delta$  8.41 (1H, s), 7.98-7.88 (4H, m), 7.62-7.53 (3H, m), 6.97 (1H, dd,  $J = 15.8, 5.0$ ), 6.03 (1H, d,  $J = 15.8$ ), 4.94-4.90 (1H, m), 4.19 (2H, q,  $J = 7.0$ ), 2.57-2.38 (2H, m), 2.17-2.11 (2H, m), 1.27 (3H, t,  $J = 7.0$ ). ## BIOCHEMICAL AND BIOLOGICAL EVALUATION

Results of biochemical and biological tests conducted using various compounds of the invention are described below.

### Inhibition of Rhinovirus 3C Protease Activity

Stock solutions (50 mM, in DMSO) of various compounds were prepared; dilutions were in the same solvent. Recombinant rhinovirus 3C proteases (see Birch et al., "Purification of recombinant human rhinovirus 14 3C protease expressed in Escherichia coli," *Protein Expr. Pur.* 1995, 6(5), 609-618) from serotypes 14, 16, and 2 were prepared by the following standard chromatographic procedures: (1) ion exchange using Q Sepharose Fast Flow from Pharmacia; (2) affinity chromatography using Affi-Gel Blue from Biorad; and (3) sizing using Sephadex G-100 from Pharmacia. Each assay sample contained 2% DMSO, 50 mM tris pH 7.6, 1 mM EDTA, a test compound at the indicated concentration, approximately 1 μM substrate, and 50-100 nM protease. The *k*<sub>obs</sub>/*I* values were obtained from reactions initiated by addition of enzyme rather than substrate. RVP activity was measured in the fluorescence resonance energy transfer assay. The substrate was (N-terminal) DABCYL-(Gly-Arg-Ala-Val-Phe-Gln-Gly-Pro-Val-Gly)-EDANS. In the uncleaved peptide, the EDANS fluorescence was quenched by the proximal DABCYL

group. When the peptide was cleaved, the quenching was relieved, and activity was measured as an increase in fluorescence signal. Data were analyzed using standard non-linear fitting programs (Enzfit), and are shown in the Table below. In the Table, unless otherwise indicated, all data are for rhinovirus 3C protease from HRV serotype-14 (produced from the infectious cDNA clone constructed by Dr. Robert Rueckert, Institute for Molecular Virology, University of Wisconsin, Madison, Wisconsin). The data in the column designated  $k_{\text{obs}}/[I]$  were measured from progress curves in enzyme start experiments.

#### 10 Antirhinoviral H1-HeLa Cell Culture Assay

In this cell protection assay, the ability of compounds to protect cells against HRV infection was measured by the XTT dye reduction method, which is described in Weislow et al., *J. Natl. Cancer Inst.* 1989, vol. 81, 577-586.

H1-HeLa cells were infected with HRV-14 at a multiplicity of infection (m.o.i.) of 0.13 (virus particles/cell) or mock-infected with medium only. Infected or mock-infected cells were resuspended at  $8 \times 10^5$  cells per mL, and incubated with appropriate concentrations of the compounds to be tested. Two days later, XTT/PMS was added to test plates and the amount of formazan produced was quantified spectrophotometrically at 450/650 nm. The EC<sub>50</sub> value was calculated as the concentration of compound that increased the percentage of formazan production in compound-treated, virus-infected cells to 50% of that produced by compound-free, mock-infected cells. The 50% cytotoxic dose (CC<sub>50</sub>) was calculated as the concentration of compound that decreased the percentage of formazan produced in compound-treated, mock-infected cells to 50% of that produced by compound-free, mock-infected cells.

All strains of human rhinovirus (HRV) for use in this assay were purchased from American Type Culture Collection (ATCC), except for HRV serotype-14 (produced from the infectious cDNA clone constructed by Dr. Robert Rueckert, Institute for Molecular Virology, University of Wisconsin, Madison, Wisconsin). HRV stocks were propagated and viral assays were performed in H1-HeLa cells (ATCC). Cells were grown in minimal essential medium with 10% fetal bovine serum, available from Life Technologies (Gaithersburg, MD).

The compounds were tested against control compounds WIN 51711, WIN 52084, and WIN 54954 (obtained from Sterling-Winthrop Pharmaceuticals), Pirodavir (obtained from Janssen Pharmaceuticals), and Pleconaril (prepared according to the method described in Diana et al., *J. Med. Chem* **1995**, vol. 38, 1355). Antiviral data obtained for the test compounds are shown in the Table, where all data are for HRV serotype-14 unless otherwise noted in parentheses. The designation "ND" indicates that a value was not determined for that compound.
